

Innovation & Design

Project planning and design can allow the integration of various green elements into the home and produce quantifiable environmental and human health benefits. Planning can provide the assessment and mitigation of long-term durability risks, maximize the green potential of the home and landscape, and allow the coordination and integration of various green opportunities. Implementation of these elements can significantly reduce long term energy and repair costs and can take place over the course of several years.

Options available to existing homes:

Green Strategies & Goals
Lifespan of Existing Materials & Systems
Green Masterplan
Budget & Timeline
